

Theme 1: AGRITECH

Description: Agritech focuses on digital tools that simulate and enhance agricultural decision-making, using apps and dashboards to provide insights based on available data like weather forecasts and user inputs. With no access to physical sensors, solutions should use mock data or APIs to demonstrate concepts, creating intuitive interfaces for farmers to visualize optimizations in water use, crop health, and market access. The emphasis is on building prototypes that could scale real data sources post-hackathon, promoting accessibility and ease of use in a short timeframe.

Key Focus Areas :

- Simulating resource optimization through data visualizations and recommendations.
- Prototyping disease detection via image uploads and AI simulations.
- Designing marketplaces with user-friendly listings and transactions.
- Creating dashboards for livestock monitoring using hypothetical scenarios.

Example Ideas:

1. **IoT Simulation Dashboard for Crop Monitoring:** Create a simple web app or Figma prototype with a dashboard displaying mock sensor data. Add a weather API call for basic forecasts and show alerts as text or simple charts.
2. **AI Disease Diagnostic App Prototype:** Build a mobile app mockup in Figma or a basic web page where users "upload" images and see simulated results. Use a free image API for basic recognition if available but keep it simple with dropdown selections.
3. **Farm-to-Consumer Marketplace App:** Develop a web or mobile prototype with static listings of produce. Include search by location using a maps embed and basic "add to cart" functionality.
4. **Livestock Health Tracker Interface:** Design an app with mock image uploads and simple status displays.

Theme 2: CIRCULAR ECONOMY

Description: The circular economy theme centers on digital platforms that facilitate waste reduction and reuse through apps and marketplaces, simulating logistics and exchanges without physical components. In a 2-day format, prioritize functional demos of platforms that could connect users virtually, emphasizing engagement and education to drive behavioral change.

Key Focus Areas:

- Prototyping food waste apps with listing and pickup simulations.
- Designing recycling logistics with route visualizations.
- Building repair marketplaces with user profiles and tools.
- Creating B2B exchanges using data dashboards.

Example Ideas :

1. **Food Waste Redistribution App:** Build a mobile app or web page with mock food listings. Add geolocation simulation and basic booking buttons.
2. **Recycling Collection Service App:** Create a prototype with a map view showing mock pickup points and routes. Include simple reward counters and sorting tips as text.
3. **E-Waste Repair Marketplace:** Develop a web app with user profiles and repair listings (mock data). Use dropdowns for diagnostics and basic search.
4. **Industrial Waste Exchange Dashboard:** Make a web dashboard with tables of mock waste items and calculators for savings.
